

## ABSTRACT

1           A system and method for enabling a potential home buyer to remotely view  
2 information about a home, such as a picture of a home that is not currently on the market,  
3 and compensating a homeowner for allowing information about a home to be transmitted.  
4 In this way, a homeowner who is not interested in selling a home may allow a picture of  
5 the home to be displayed remotely by a remote home viewing system in exchange for  
6 receiving a payment. The payment is based on compensation information associated with  
7 the home. The remote home viewing system includes a central processor for receiving and  
8 storing, for example, information associated with a homeowner who wishes to  
9 anonymously display a picture of a home in return for periodic payments in accordance  
10 with a payment determination rule. A viewer accesses the central server via a viewer  
11 device to select pictures of the homeowner's home. The central server transmits the  
12 picture, in response to the viewer's request, for a predetermined viewing fee. The central  
13 server may then debit the viewer's financial account and credit the homeowner's financial  
14 account based on the payment determination rule.
